# Global Status of Biotech Crops in 2004

BIOTECH MEGA-COUNTRIES	
50,000 hectares or more	
USA:	47.6 million
Argentina:	16.2 million
Canada:	5.4 million
Brazil:	5.0 million
China:	3.7 million
Paraguay:	1.2 million
India:	0.5 million
South Africa:	0.5 million
Uruguay:	0.3 million
Australia:	0.2 million
Romania:	0.1 million
Mexico:	0.1 million
Spain:	0.1 million
Philippines:	0.1 million
50,000 hectares or less	
Colombia	Honduras
	Germany

Increase over 2003

**20%**

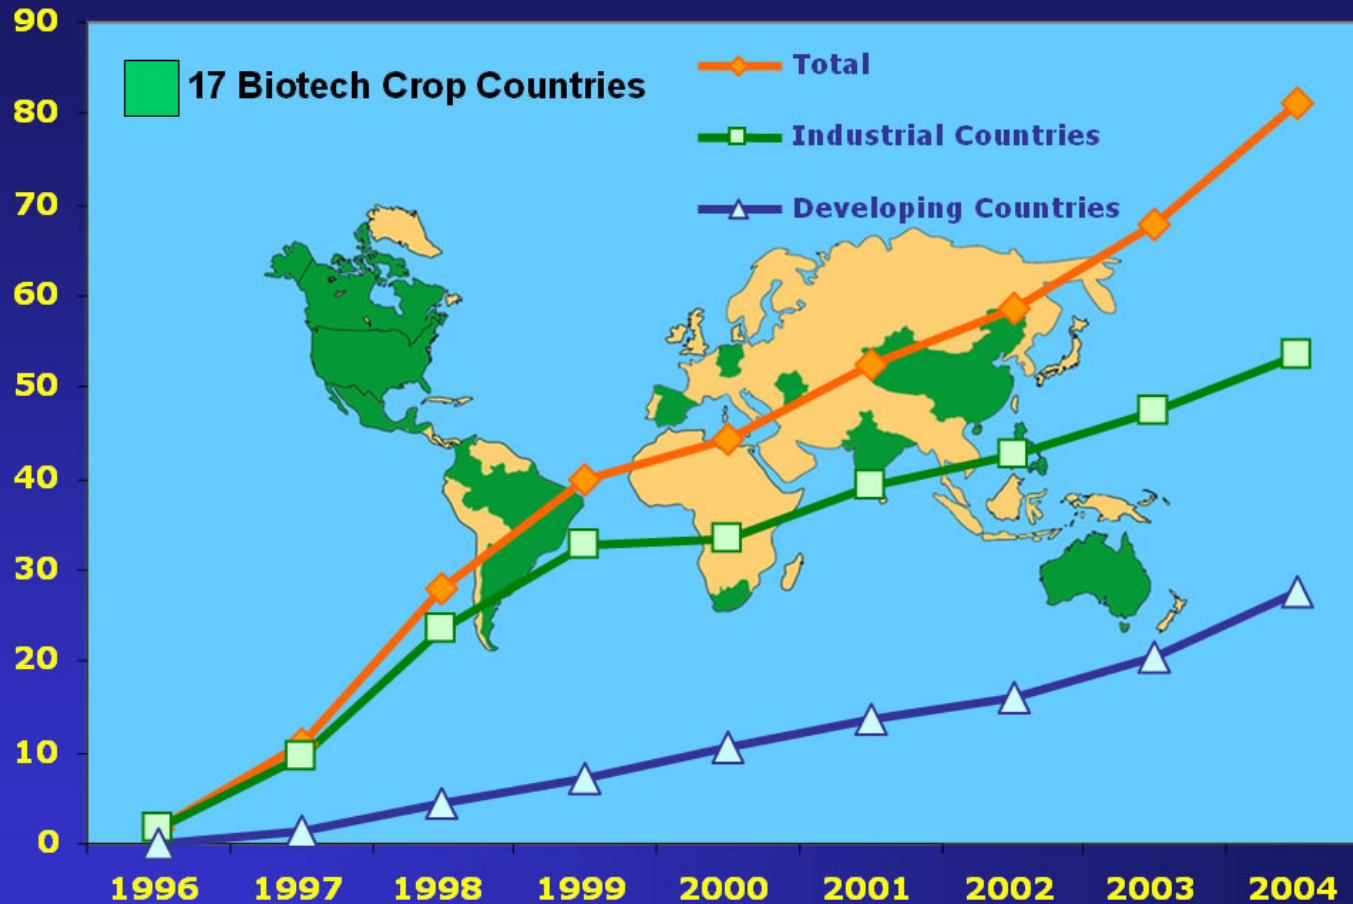

## 17 countries have adopted biotech crops

In 2004, global area of biotech crops was 81 million hectares, representing an increase of 20% over 2003, equivalent to 13.3 million hectares.

Source: Clive James, 2004 ISAAA Briefs 32

# Transgênicos no Mundo. Evolução 1996 - 2004

## Global Area of Biotech Crops Million Hectares (1996 to 2004)

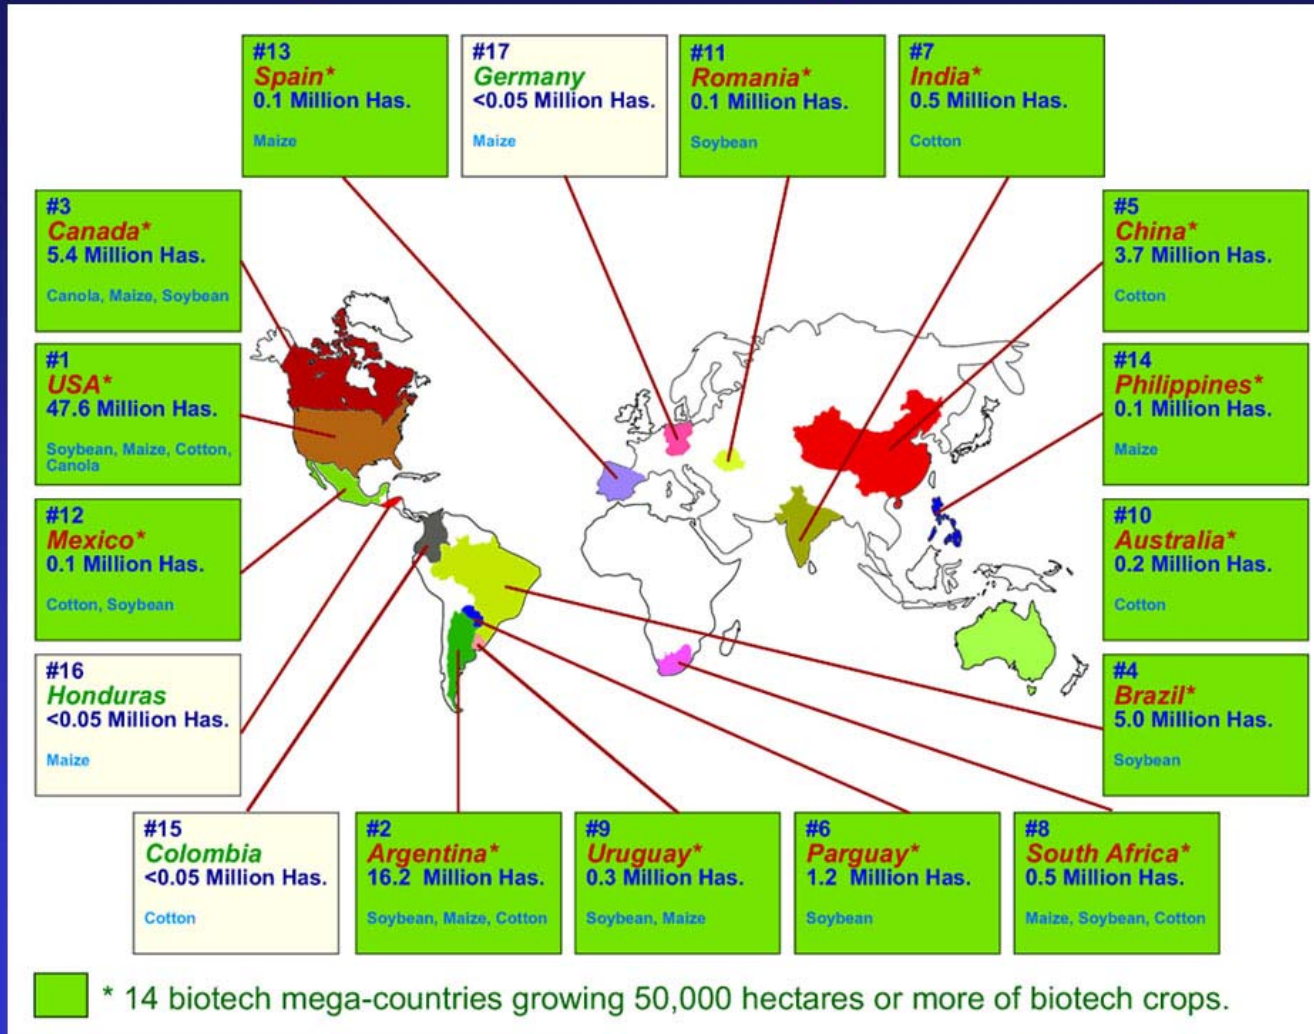

*Increase of 20%, 13.3 million hectares of 32.9 million acres between 2003 and 2004*

Source: Clive James, 2004

## Biotech Crop Countries and Mega-Countries\*, 2004

## Dominant Biotech Crops , 2004

	Million hectares	% transgenic
Herbicide Tolerant Soybeans	48.4	60
Bt Maize	11,2	14
Bt Cotton	4,5	6
Herbicide Tolerant Maize	4,3	5
Herbicide Tolerant Canola	4,3	5
Bt / Herbicide Tolerant Maize	3,8	4
Bt / Herbicide Tolerant Cotton	3	4
Herbicide Tolerant Cotton	1,5	2
<b>Total</b>	<b>81</b>	<b>100</b>

***Regular meetings to discuss funding of sugarcane biotech research.***

***Since 1991, twenty research projects totalling U\$ 3,2 million have been funded:***

***Cornell University, BYU, Texas A&M, Clemson, Univ Georgia, CIRAD (France), Southern Cross Univ. (Australia) are some of the recipients of ICSB funds.***

***Embriogenic callus***

***Particle bombardment***

***Laboratory selection***

***Transplant and field test***

# *Herbicide tolerant sugarcane Brasil*

Imazapic = US\$ 28,50 /ha

Diuron, Hexazinone = US\$ 37,50/ ha

Ametryne + 2,4,D = US\$ 27,60/ ha

Sulfentrazone = US\$ 56,00 /ha

Application = US\$ 7,50 /ha

Glyphosate 3l/ ha = US\$ 7,50 /ha

Application = US\$ 7,50 /ha

# Benefit of herbicide tolerant cane for Louisiana

- *Ed Richard USDA/ARS*
  - Louisiana produces 15,000,000 t = US\$ 385 M
  - Present herbicide reduce production by 5%
  - Change in production: + 800,000 t = US\$ 19,9 M
  - Pesticide use: - 514,000 lbs /yr
  - Production cost : - US\$ 10 M/yr

# *Insect resistance*

**Genetic transformation for sugarcane borer (*Diatraea saccharalis*) resistance.**

Bioensaio

Bioensaio

**Field test**

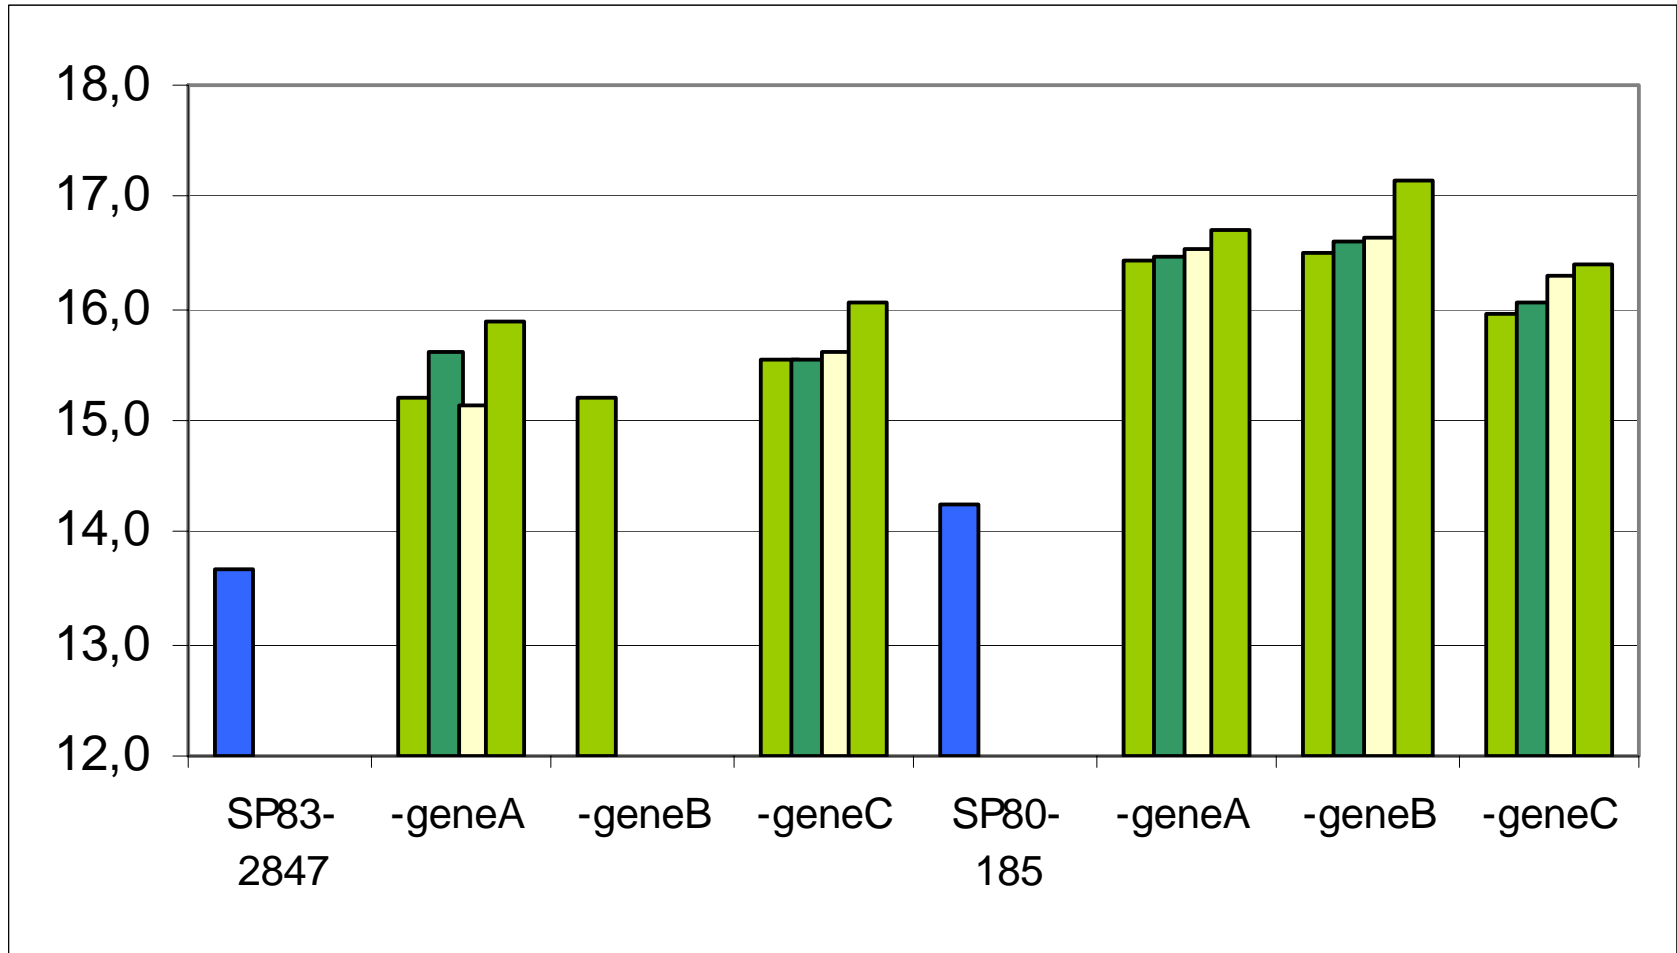

**Transgenic**

**Control**

# Sucrose enhancement

Sucrose content in selected transformed clones in which specific carbohydrate metabolism genes have been silenced.

# Flowering in sugarcane

## PoucaFlor - flower suppressing gene

20 J 2004

# Global Status of Transgenic Sugarcane

- There is no commercially grown transgenic sugarcane.
- Research and development of transgenic sugarcane has been identified in:
  - Australia, Argentina, Brazil, Cuba, Egypt, India, Indonesia, Mauritius, Myanmar, South Africa, USA, Venezuela

Perceived **benefits** by those developing transgenic sugarcane

<b>Transgenic sugarcane will :</b>	
Decrease the cost of producing cane or sugar	1
Permit the production of other products ( vaccines, plastics etc)	2
Improve the quality of sugar	3
Reduce the environmental impact of sugarcane production.	3
Expand sugarcane production to new areas	4

# Global Status of Transgenic Sugarcane

## Barriers perceived by those developing transgenic sugarcane

<b>Barriers to development and deployment of transgenic sugarcane</b>	
Access to genes.	1
Difficulties associated to negotiating rights to use genes from third parties.	2
High cost associated to research in molecular biology and transformation.	3
Regulatory issues.	3
Negative public perception.	3
Market issues (difficulties in commercializing sugar from transgenic crops).	4
Access to adequate transformation technique.	5
Perceived negative environmental impacts of transgenic sugarcane.	6
Access to qualified technical personnel.	7

# Risk Assessment for Transgenic Crops

---

<b>Assessment Criteria for Environmental Safety</b>	
1	Potential of Becoming a Weed of Agriculture or to be Invasive of Natural Habitats.
2	Potential for gene Flow to Wild Relatives Whose Offspring may Become More Weedy of More Invasive.
3	Potential Impact on Non-Target Organisms.
4	Potential Impact on Biodiversity.
5	Potential for the Development of Multiple Herbicide Tolerant Volunteers and Herbicide Tolerant Weeds.
<b>Assessment Criteria for use as Food or Livestock Feed</b>	
1	Nutritional Composition.
2	Anti-Nutritional Factors.

Assessment must be made on a case by case basis, but sugarcane rates well on most of these issues.

# Sugar from transgenic crops

Sugarbeet	Country, Approval, Year
T120-7	US, Environmental, 1998 US, Food and/or Feed 1998 Canada, Food, 2000 Canada, Environment, 2001 Canada, Feed, 2001 Japan, Food, 1999 Japan, Feed, 1999
GTSB77	US, Environment, 1998 US, Food and/or Feed 1998 Australia, Food and/or Feed 2002 *
H7-1	US, Food and/or Feed, 2004

As used for human consumption, sugar beet is generally converted directly to refined white sugar (which is composed almost entirely of sucrose) through extensive purification processes. The CP4 EPSPS protein introduced into GTSB77 sugar beet was expressed at low levels in the sugar beet tuber, **and was not detectable in refined sugar or molasses derived from sugar beet GTSB77**. Consequently, there is no anticipated human exposure to this protein as a result of consumption of refined sugar derived from GTSB77 sugar beet

## **In Conclusion :**

---

Is the use of transgenic sugarcane a BMP?

Yes, it can be.

Because transgenic sugarcane can increase yields, reduce production costs, improve sugar quality and reduce the environmental impact of sugarcane cultivation.

**BUT !!!**

Each transgenic event must be analysed separately, because the impact (benefit and risk) of each trait will be different.

Strong and reliable regulatory agencies are needed.
